

IPv6 Tunnel Broker

Instant Connection to IPv6 World!

Q: What is IPv6 Tunnel Broker?

A: IPv6 tunnel broker is a semi-automated way to connect an IPv4 machine to the IPv6 Internet, by creating an IPv6-over-IPv4 tunnel between the IPv4 machine and an IPv6 tunnel server. This way IPv6 packets can ride on top of IPv4 packets over normal IPv4 network to reach the other side which is an IPv6 network.

Q: How to use IPv6 Tunnel Broker?

A: You just need to register for an account, log in, and create a tunnel. You will be asked a few questions. Just follow the steps until you are asked to download a script. Choose the appropriate script according to your OS, download, and run it. Viola! You will be connected to the IPv6 world instantly.

ขั้นตอนการสร้าง tunnel นั้นแสนง่าย
เพียงกรอกข้อมูลและดาวน์โหลด
script มาลงบนเครื่องของท่าน แต่
double-click ที่ script ไฟล์ ท่านก็จะ
ได้เชื่อมต่อเข้ากับโลกของ IPv6
ทันที

Specifications

Model Number	NTL-6tb
Hardware type	Rack-mount server
Operating System	Linux
Network Interfaces	Two 10/100/1000 Mbps Interfaces
User Authentication	SQL Database
Tunnel Types	6in4
Max. Concurrent Sessions	600
Client OS Supported	Windows XP, Linux (Fedora Core)

Features

- Automatically set up permanent or semi-permanent IPv6 tunnels on client's machines to IPv6 service provider
- Tunnel client software lets users create an IPv6 tunnel without configuration knowledge
- Web-based user management and administrative management
